Answer: A,B

QUESTION NO: 4

Which data included in each event included in the event log consolidator correlates with the error message that an end-user reports?

A. Reference ID
B. Resource group
C. Resource
D. Start time

Answer: A

QUESTION NO: 5

Which rule must be followed when attempting to change the service account for an access server farm in which the credentials have been compromised?

A. The new account must be granted System Administrator privileges by the administrator during the change.
B. A user account in the same domain as the service account must be used to change the credentials.
C. The administrator must use the Server Configuration Tool to change the service account on each server in the farm.
D. An administrator must use the Access Suite Console to change the service account on all servers.

Answer: C

QUESTION NO: 6

Where does an administrator configure the conditions that users must meet to be able to see the logon page?

A. In a policy
B. In the properties of an endpoint analysis scan
C. In logon point properties
D. In a filter

Answer: C

QUESTION NO: 7

Which setting must be configured in a policy to secure the privilege of logging onto an access server farm?

A. Permit Access Control

B. Allow Logon Resource

C. Access Action Control

D. Show Logon Resource

Answer: B

QUESTION NO: 8

Scenario: An administrator is required to create a scan that will scan client devices to ensure that all clients running Windows XP Professional also have service pack 1(SP1) installed and running. All users in the environment are required to have a specific version of an antivirus software running on their systems.

Due to the addition of a newly acquired office, the scan requirements have to be modified. Newly acquired remote offices, which will obtain access to company resources through Access Gateway, have client devices that run on Windows 98 and are not required to submit to the same scans that are required of the other users.

By configuring rules for the end point analysis scan, the administrator can ensure that only the devices in the new offices will not be required to meet the same security requirements that are required for the other corporate users.

Which condition type should be added to the rules for the scan to ensure that the requirements for the scenario are met?

A. Client device regional locale

B. Logon point

C. Property value

D. Operating system

Answer: D

QUESTION NO: 9

In an environment that restricts client device access to resources based upon the presence of a specific version of an antivirus software, which step must be completed for a continuous process scan?

A. Type the earliest date stamp that is acceptable for the process.

B. Clear the MD5 field.
